

Combine video, access control and security in one place

Inception is an integrated access control and security alarm system with an edge.

In addition to its sleek, modern design, Inception's software is built directly into the controller - so the only tool you will need is a web browser.

With a step by step commissioning guide and simple interface, Inception is easy to install, easy to use and outstandingly powerful in its class.

WEB POWERED SECURITY

Web Powered Convenience

With Inception there is no need to install software on a computer, no need to leave a computer on site and no issues with software/firmware compatibility. Instead, the installation process is as simple as powering up the controller, connecting the network cable (or use the optional WiFi adapter) and using any web browser to navigate to Inception's web page. Here you will find everything you need to set-up, commission and operate the entire system.

End users can conveniently use any existing computer, tablet or smartphone to control their Inception system via the fully featured user interface.

Seamless Integration

The integration brings Inception's access control and security features directly into Milestone's XProtect Smart Client. Use one centralized interface to manage and control your whole site.

Take Full Control of your Site

- **Full Door, Area, and Output State and Control** – Live state for these items are synced to Milestone and can be interacted with via the XProtect client. These items can be displayed on site maps in Milestone with full control abilities. They can also be controlled by the Milestone Mobile App.
- **Live Event Syncing** – A wide range of events including access and alarm events are sent to Milestone as soon as they occur. Milestone can in-turn trigger automated response actions and create alarm events based on these events.
- **Dynamic User Syncing and Editing** - Users are dynamically synced into Milestone with new users and changes automatically appearing in the Milestone interface. Shortcut links allow users to be managed directly from the XProtect interface.
- **Operator-verified Access Requests** – Primary entry doors can display live video footage next to a user's photo for an operator to verify before granting access through a door.
- **Embedded Inception Interface** - Inception's web interface can be shown directly within the XProtect client allowing full configuration abilities without leaving the XProtect Smart Client.
